Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin binding domains of human fibronectin.

Example 6; Fig 22b; 58pp; English.

This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBD) protein coding sequence. The invention relates to a hybrid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC plasminogen activator (PA) comprises a polypeptide fusion between CC fibrin binding regions of human fibronectin, which are from fibrin CC binding domains (PB) 4 and 5 or 1 and 2. The hybrid PA possesses the CC ability to bind with fibrin independently and also characteristically CC retains a PG activation ability which becomes evident only after a CC pronounced duration, or lag, after exposure of the PA to a suitable CC animal or human PC. The hybrid streptokinase-fibrin binding domain CC polypeptides are useful in thrombolytic therapy for various kinds of CC cardiovascular disorders. The hybrids have enhanced fibrin selectivity as CC well as kinetics of plasminogen activation that are distinct from that of CC natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of CC plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins CC can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating CC plasminogen to plasmin openess to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBD) protein coding sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, fibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of
                                                                                                                                                                                                                                                                                                                                                                                                    Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin by domains of human fibronectin.

The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating plasminogen to plasmin, thus aiding in the localisation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation nencountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)

Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin binding human fibronectin.

Disclosure; Fig 17b; 58pp; English

This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBD) protein coding sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between contribution between the streptokinase (SK), which are capable of plasminogen (PG) activation, and contribution binding regions of human fibronectin, which are from fibrin contribution binding regions of human fibronectin, which are from fibrin contribution binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the contribution between the protein ability to binding domains (PBD) 4 and 5 or 1 and 2. The hybrid PA possesses the contribution and the protein activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable contribution of the proteins are useful in thrombolytic therapy for various kinds of contribution of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of contribution to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1967
```

Hybrid streptokinase-fibrin binding domain polypeptides useful for thrombolytic therapy comprises a streptokinase fused with fibrin binding domains of human fibronectin.

5 Fig 19b; 58pp; English.

binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolyvic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of This sequence represents a chimeric streptkinase-fibrin binding domain (SK-FBB) protein coding sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptckinase (SK), which are capable of plasminogen (PC) activation, a fibrin binding regions of human fibronectin, which are from fibrin that the first plasminogen (PC) activation. plasminogen to plasmin (i.e. delayed-action thrombolysis). The and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen to plasmin, thus aiding in the localisation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
The present invention describes an isolated bacterial protein that CC induces fibrin-dependent plasminogen activation in a pharmaceutical CC composition for dissolving blood clots. Also described are: (1) a CC composition comprising an isolated modified streptokinase, the CC composition comprising an isolated modified streptokinase, the CC modification being removal of amino acid residues in the amino terminus; CC (2) a method for dissolving a blood clot in a subject, comprising CC administering to the subject a fibrin-dependent streptokinase protein; a CC nucleic acid (1) encoding a modified bacterial streptokinase; (3) an CC expression vector comprising (1); and (4) a host cell transformed with CC the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving CC bacterial fibrin-dependent plasminogen activator is useful for dissolving conformation, venous thrombosis, pulmonary embolism, cerebral thrombosis, CC graft thrombosis and arterial thrombosis. The modified streptokinase can also be used in non-human mammals. Streptokinase activation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ş

The modified streptokinase has at least one amino acid substitution that inactivates substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence encodes a streptokinase and maltose binding protein fusion protein from an example of the process and maltose binding protein fusion protein from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           example of the present invention

XX This sequence represents a streptokinase-NTRN (SK-NTRN) gene (where NTRN stands for N-terminally repaired with native sequence). The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, and fibrin binding regions of human fibronectin, which are from fibrin binding domains (PBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that

The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen to plasmin, thus aiding in the localisation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use of streptokinase. (Updated on 15-SEP-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                           1188

N-terminally deleted streptokinase

Claim 44; Page 58-60; 73pp; English.

induces fibrin-dependent plasminogen activation in a pharmaceutical composition for dissolving blood clots. Also described are: (1) a composition comprising an isolated modified streptokinase, the modification being removal of amino acid residues in the amino terminus; (2) a method for dissolving a blood clot in a subject, comprising administering to the subject a fibrin-dependent streptokinase protein; a nucleic acid (1) encoding a modified bacterial streptokinase; (3) an increase of the comprising (1) and (1) a host all transformed with expression vector comprising (I); and (4) a host cell transformed with the expression vector of (3). The pharmaceutical composition comprising a bacterial fibrin-dependent plasminogen activator is useful for dissolving blood clots in patients with a thrombotic condition, e.g. myocardial The present invention describes an isolated bacterial protein that

The modified streptokinase can also be used in non-human mammals. Streptokinase activation of plasminogen is at least 10-fold, preferably 100-fold greater in the presence of fibrin than in the absence of fibrin. The modified streptokinase has at least one amino acid substitution that inactivates substrate site for proteolytic cleavage. This reduces the rate of degradation of the streptokinase at least two-fold. The present sequence encodes native streptokinase (nSK). (Updated on 17-OCT-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

CC fibrin binding regions of human fibronectin, which are from fibrin CC binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the CC ability to bind with fibrin independently and also characteristically CC retains a PG activation ability which becomes evident only after a CC pronounced duration, or lag, after exposure of the PA to a suitable CC animal or human PG. The hybrid streptokinase-fibrin binding domain CC polypeptides are useful in thrombolytic therapy for various kinds of CC well as kinetics of plasminogen activation that are distinct from that of CC matural streptokinase in being characterised by a temporary delay, or lag CC of several minutes in the natural rate of the catalytic conversion of CC plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins CC can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating CC blood plasminogen to plasmin, thus aiding in the localisation of the plasminogen activation encountered during clinical use CC overcomes systemic plasminogen activation encountered during clinical use CC of streptokinase. The invention relates to a fusion protein or a conjugate comprising vasodilator polypeptide, or its active fragment, and a thrombolytic polypeptide or its active fragment. The protein is useful for treating the protein is useful for treating the protein in the protein is useful for treating the protein in the protein is useful for treating the protein in the protein is useful for treating the protein in the protein is useful for treating the protein in the protein is useful for the protein in the protein in the protein is useful for the protein in the protein in the protein is useful for the protein in the protein in the protein is useful for the protein in the protein in

treating

polypeptide and polypeptides.

a thrombolytic

polypeptide,

or active

Example 1; Fig 2; 37pp; English

The polynucleotide encoding the polypeptide is useful in gene therapy. The vasodilatory action of the protein allows for the use of lower doses of thrombolytic while maintaining the clot dissolving effectiveness of the thrombolytic, and the use of lower doses of the thrombolytic reduces associated side effects. The present sequence is the streptokinase cDNA used in the construction of a Maxadilan-Streptokinase fusion protein. Maxadilan is a vasodilator peptide produced by the salivary gland of the New World sand fly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 1254 BP; 426 A; 271 C; 241 G;

S

causing unstable angina, acute myocardial infarction or stroke. The polymuclectide encoding the polypsptide is useful in gene therapy. "vasodilatory action of the protein allows for the use of lower doses thrombolytic while maintaining the clot dissolving effectiveness of

The invention relates to a fusion protein or a conjugate comprising vasodilator polypeptide, or its active fragment, and a thrombolytic polypeptide or its active fragment. The protein is useful for treatily polypeptide or its active fragment. The protein is useful for treatily polypeptide or its active fragment. The protein is useful for treatily occluded blood vessel, and the protein its protein from a partially or totally occluded blood vessel.

for treating

The present sequence is the plasmid used for the preparation of Maxadilan-Streptokinase fusion protein. It contains maxadilan cDNA, which encodes a vasodilator peptide produced by the salivary gland of the New World sand fly, and streptokinase cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     문
      The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the Pro58-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence encodes native SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPIg) to plasmin (HPIm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic
                                                                                                                                                                                                                                                                                                                                                                                                               plasma clot; hydrolysis; haemolytic Streptococcus; plasminogen; serine protease; fibrin; blood clot; thrombolytic; vascular thromboembolytic symptom; acute myocardial infarction; fibrinolysis; resistance; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen.                                        The DNA encodes an FB-FB dimer linked to the streptokinase coding sequence. The FB fragment has selective affinity for fibrin, low affinity for fibrinogen, and minimal immunogenicity, imparting thrombus-targetting capability. See also AAQ11649 and AAQ11650

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                             The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the ProS8-Lys59-Ser60-Lys61 segment of the corresponding native SK is replaced by another amino acid. The present sequence encodes mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to actalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with will-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptococcus equisimilis H46A; streptokinase; mutant; fibrinoly plasma clot; hydrolysis; haemolytic Streptococcus; plasminogen; serine protease; fibrin; blood clot; thrombolytic; vascular thromboembolytic symptom; acute myocardial infarction; fibrinolysis; resistance; ds.

                                                  This sequence represents a streptokinase-NTR (SK-NTR) gene (where NTR CC stands for N-terminally repaired with native sequence). The invention CC relates to a hybrid plasminogen activator (PA) comprises a polypeptide CC fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, and fibrin binding regions of human fibronectin, which are CC from fibrin binding domains (PB) 4 and 5 or 1 and 2. The hybrid PA CC possesses the ability to bind with fibrin independently and also CC characteristically retains a PG activation ability which becomes evident CC only after a pronounced duration, or lag, after exposure of the PA to a Suitable animal or human PG. The hybrid streptokinase-fibrin binding CC domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that CC of natural streptokinase in being characterised by a temporary delay, or CC lag of several minutes in the natural rate of the catalytic conversion of CC plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins CC an bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating CC overcomes systemic plasminogen activation encountered during clinical use of streptokinase.                                                                                                                                                                                                                                                    This sequence encodes the wild type plasminogen-binding fragment of streptokinase. The protein fragment encoded by this sequence was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus rather than by continuous infusion. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                           Modified forms of streptokinase resistant to enzymatic cleavage - usefu as thrombolytic agents in treating thrombosis and in medical equipment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Perfect score:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
